

ELEC3609/9609 MILESTONE

StudyCrew Proposed MVP

A realistic, assessable web application scope for tutor approval

A design for visible work, earlier intervention and fairer team conversations.

Product in one paragraph

StudyCrew is a responsive web application that helps university project teams plan work, coordinate meetings and review factual contribution evidence in one private project space. It addresses two recurring team risks: important work becoming visible too late, and contribution discussions relying on memory rather than traceable activity.

MVP promise A team can create a protected workspace, organise tasks and meetings, then reconcile contribution activity with the source events that produced each total.

Core feature set

#	Capability	Requirements	Demonstrable outcome
1	Account and profile	FR-AUTH-01/02, FR-PROF-01	Register, authenticate, sign out and maintain time-zone-aware identity
2	Private projects	FR-PROJ-01/02	Create a project and join through an expiring invitation
3	Task collaboration	FR-TASK-01/02/03, FR-COLL-01	Plan, assign, progress and discuss retained work
4	Meeting coordination	FR-MEET-01/02	Schedule/cancel meetings and collect one RSVP per member
5	Contribution evidence	FR-CONTR-01/02	Append immutable events and reconcile per-member summaries
6	In-app alerts	FR-NOTIF-01	Notify relevant users about invitations, assignments, mentions and meetings
7	Access control	FR-SEC-01	Enforce membership and role checks on every protected route

Deliberate exclusions

Search/filter (FR-SEARCH-01) and PDF/CSV export (FR-EXPORT-01) are fully designed but excluded from the approved baseline. They become stretch work only after all core acceptance and security checks pass. Grading, contribution scoring, LMS integration, email delivery, live chat and native mobile apps are not planned.

Completion gates

Gate	Pass condition
Functional	Every included requirement passes its stated acceptance check
Security	Visitor, non-member, member and owner access-control matrix passes

Gate	Pass condition
Usability	Seeded desktop and mobile journeys complete without a blocked step
Reliability	No open severity-1 defect; transactions leave no partial project data
Evidence	Contribution totals reconcile exactly with the reference event query

Feasibility and implementation order

Increment	Vertical slice
1	Authentication, profile, project creation and membership boundary
2	Task board, assignment, workflow and comments
3	Meetings, RSVP and notifications
4	Activity feed, contribution dashboard and final hardening
