

Make group work visible before it becomes a problem.

One private workflow for planning, coordination and inspectable contribution evidence.

PLAN

COORDINATE

PROVE

not grade

Group work fails quietly before it fails visibly.

Two disconnected problems reinforce each other.

COORDINATION

Work is split across chat, calendars and task lists.

Status becomes stale. Blockers surface near submission.

CONTRIBUTION

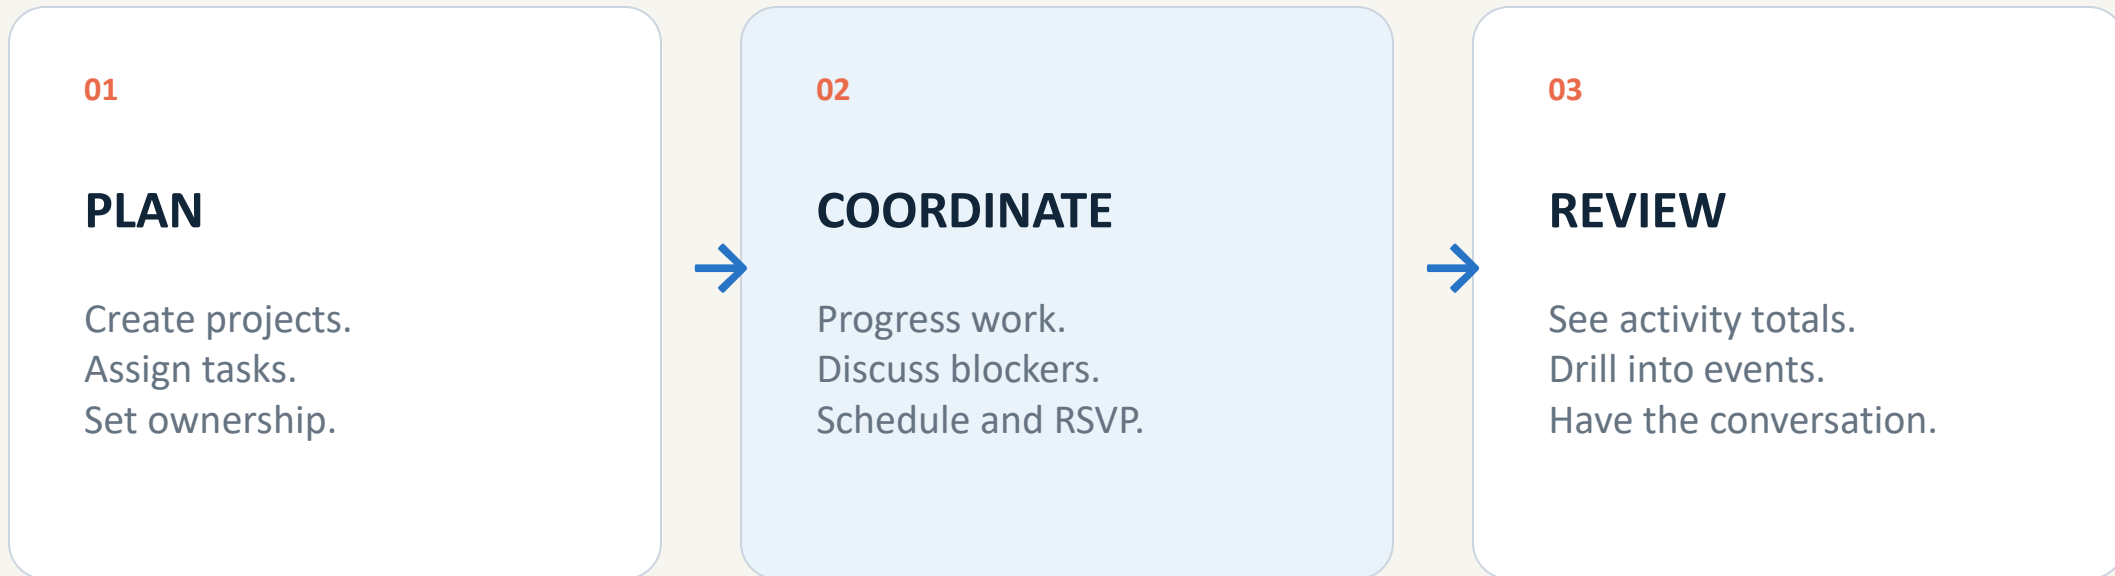

Teams reconstruct who did what from memory.

Late disputes lack shared facts and context.

ONE WORKFLOW

A simple loop: plan, coordinate, review evidence.

Every meaningful action retains its context.

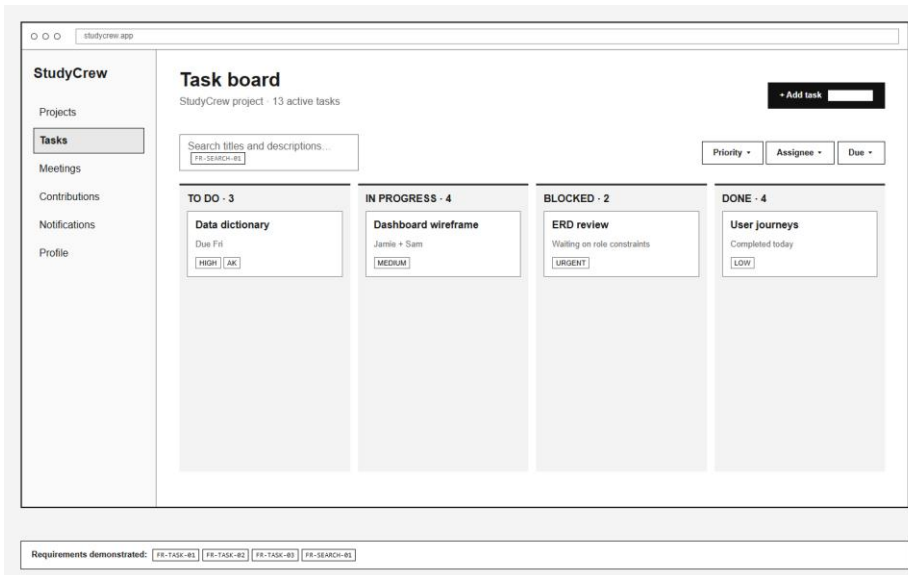

IMMUTABLE ACTIVITY EVENTS

Evidence, not an automated grade

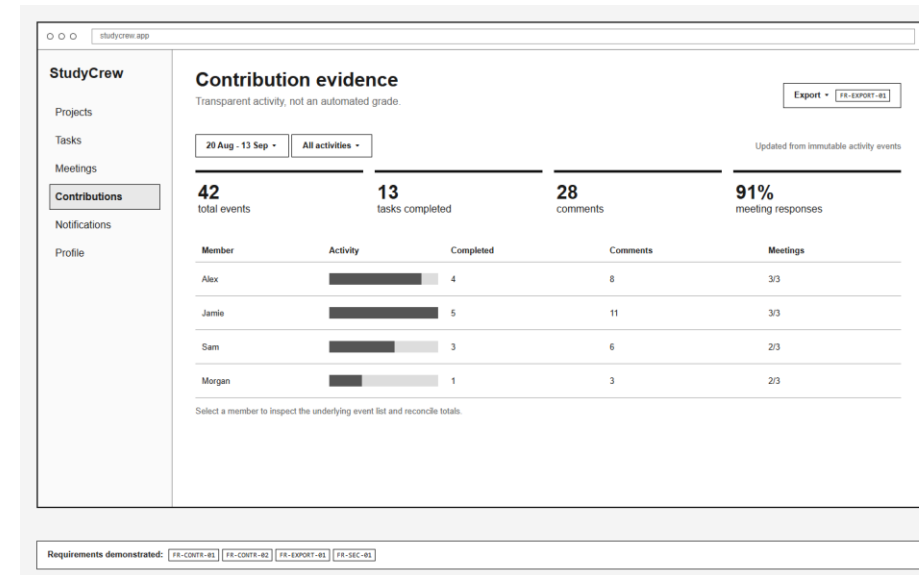

The workflow is already testable on paper.

Two views demonstrate the core value proposition.

TASK BOARD

Ownership, due dates and blockers at a glance

EVIDENCE

Counts reconcile to inspectable source events

The data model makes the promise enforceable.

Normalised relationships, explicit constraints and a project access boundary.

13

normalised tables

18

traceable requirements

11

generic views

SECURITY BOUNDARY

Every protected request validates the session, current project membership and role before reading or changing data.

REQUIRED CARDINALITIES

users 1 : 1 profiles

projects 1 : N tasks

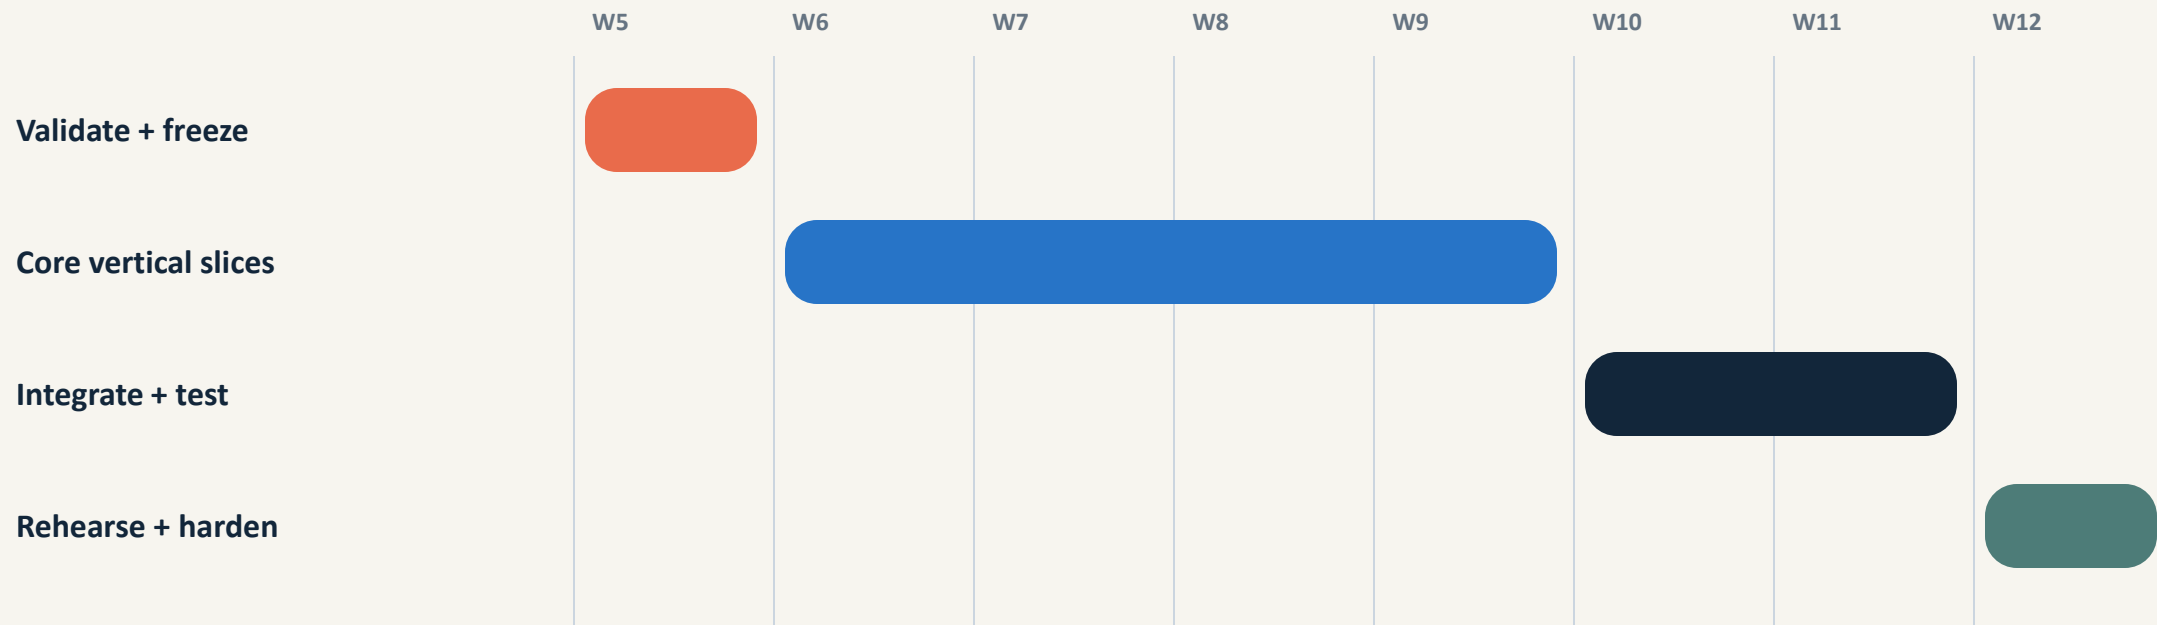

tasks M : N users

BUILD STACK

React · Express · PostgreSQL + Prisma · Vitest + Playwright · Docker + GitHub Actions

Freeze the MVP. Deliver tested vertical slices.

Weeks 5-12, with search and export held behind the core quality gates.

MVP DECISION

Approve the 15-requirement baseline; keep search and export as gated stretch work.
